Viking EcoStar: an environmental superstar

Viking EcoStar tiles capture the authentic appearance of natural slate or natural hand-split cedar wood tiles.

Manufactured from recycled polymer, this is a practical solution for period homes; historic buildings; or for modern buildings requiring the same authentic appeal.

Viking EcoStar Majestic Slate Tiles

These tiles utilise post-industrial recycled compounds to create a lightweight and environmentally responsible alternative to natural slate. Significant maintenance and frequent repairs are no longer required with majestic slate tiles.

Viking EcoStar Seneca Shake Tiles

These tiles replicate the look of natural hand-split cedar shakes. The moulds used to manufacture EcoStar Seneca Shake have been custom crafted using real wood shake tiles as a template to create an intricate texture that appears truly natural.

Maintenance, short life cycle and rot are challenges often associated with natural wood shake roofing. EcoStar Seneca Shake is the trouble-free solution designed to eliminate the extensive maintenance of natural shakes while offering a level of durability and performance building owners can depend on.

What makes EcoStar the right choice for you?

Longevity

EcoStar tiles are: flexible; won't crack; and have a high impact resistance; providing protection against the most extreme conditions such as rain, hail, snow and fire.

Light Weight

The unique formulation of EcoStar renders several advantages over slate roofing whilst still offering the look and durability. Despite emulating Welsh slate, the EcoStar system is approximately half the weight; placing less stress on the building structure.

Recyclability

Viking EcoStar tiles are the most environmentally friendly on the market, being composed of 80% post-industrial recycled rubber and plastics from the likes of old car bumpers; door mouldings; radiator hoses; and even off-cuts from the manufacture of disposable diapers!

They are also 100% recyclable at the end of their useable life. By utilising recycled materials in the manufacturing process, EcoStar offers a proven alternative to its natural counterparts with enhanced performance and minimal environmental impact allowing you to reach a new level of sustainability with your project.

Temperature and UV Resistance

Every Viking EcoStar tile is formulated to resist extreme temperature variations. Additionally, UV testing (performed with a 'xenon-arc weatherometer') have officially reported EcoStar tiles to comfortably withstand UV treatment consistently above New Zealand's UV levels.

Superior Substrate

The structural integrity of all Viking roofing products is enhanced through the installation of a timber sarking substrate onto which they are fastened. This durable and light-weight substrate, braces the entire building; negating the need for extra structural requirements for heavy weight roofing materials.

StrandSarking is the best option as a substrate for EcoStar tiles. Designed in New Zealand, its benefits far outweigh the alternatives. For more information visit our website www.vikingroofspec.co.nz

Wind Resistance

The 261kmph wind rating (officially classified as 'Very High') guarantees years of performance in tough conditions.

Peace of mind

All Viking tiles have been assessed by the independent laboratory officially referenced by the uncompromising American legal system – 'Underwriters Laboratory' (U.L.) - assessing their collective resistance to: wind uplift; UV; and impact.

Craftsmanship

To ensure that this critical quality control continues through to installation, Viking EcoStar tiles are installed by a nationwide network of Viking Approved Applicators selected and trained to install your roof to the highest of standards.

Warranties of Substance

Viking EcoStar tiles come with a comprehensive 50-year product warranty.

Not all warranties are equal. The Tiri Group, an established, reputable New Zealand company with an annual turnover exceeding \$300 million, backs Viking Roofspec's warranties. The Tiri Group will honour its warranties in the unlikely event of a product issue. For more information visit our website www.vikingroofspec.co.nz

Viking Full System Warranty

For further peace of mind, certain projects may qualify for Viking's comprehensive Full System Warranty that covers both the materials and the installation in one document. For further info visit www.vikingroofspec.co.nz

Proven options to suit your needs

Returning an historic building to its former glory

St Andrews Church, Wellington

THE CHALLENGE

The St Andrews Church, located at 30 The Terrace in Wellington was originally constructed in 1923. Over 80 years later an extensive upgrade was undertaken.

The first phase of the upgrade involved renovating the external structure and roof. The roof needed to be replaced; structure strengthened for earthquakes and concrete repair and treatment undertaken. Structural enhancement was also required on the tower to ensure it was securely attached to the remainder of the building.

As a category one Heritage New Zealand building, the historic significance commanded due respect in architectural conservation. This building is the only New Zealand example of an English Baroque style church, deeming it a significant Wellington landmark.

THE SOLUTION

It was vital that the finish of the roof was sympathetic to the architectural era during which the building was erected.

The pitched roofing solution needed to be assessed by all stakeholders including the client; the architect (Opus Architecture); the Wellington City Council and Heritage New Zealand. The client and architect visited another building with a Viking EcoStar roof to view the quality of installation and aesthetics. Both parties were impressed with the authentic appearance with the added advantage over traditional slate, of being a lightweight roof. As a result, Viking EcoStar (Majestic Slate) tiles were included in the specification document.

Accordingly, on advice from the Heritage New Zealand, the Wellington City Council approved the use of Viking EcoStar on the St Andrews Church.

To ensure true craftsmanship in waterproofing and aesthetics, the roof was installed by a Viking Roofspec Approved Applicator.

THE RESULT

The 550m² St Andrews Church reroof was installed over a two month period using Viking EcoStar Majestic Slate tiles in Midnight Grey. The Viking EcoStar tile provided a watertight solution on the new plywood substrate. The finished look complemented the exterior of this outstanding and important New Zealand historical building.

CASE STUDY: Viking EcoStar Seneca Shake Tiles

Viking comes to the rescue with this Greek Revival character home

THE CHALLENGE

A beautiful 1930s double-story Greek-Revival character home was being completely renovated to protect its heritage. The existing roof had old cedar timber shakes which were tired and in need of replacement.

Only the best would suffice for the homeowner who required a roofing product that identified aesthetically with the building's architectural era; but just as importantly, stood the test of time and required little maintenance.

THE SOLUTION

The homeowner preferred the cedar look, so a representative from Viking Roofspec suggested the installation of EcoStar Seneca Shake Roof Tiles. The colour chosen was Federal Grey. This house would be the first in New Zealand to have this specification.

Viking's EcoStar Seneca Shake roofing tiles comprise of up to 80% post-industrial recycled plastic and rubber. Despite being synthetic, real cedar shakes are used as a template during the manufacturing process, to create intricate texture that truly appears natural. Unlike wood, Seneca Shake provides superior protection from the most extreme weather conditions including temperature change and UV.

The tiles were installed on a StrandSarking substrate which added significant bracing to the building compared with the traditional method of nailing individual tiles to purlins. The combined weight of the roofing system including sarking, was a surprisingly light 24 kg/m² strengthening the building's structure while lessening the stress on it.

The roof was installed by a Viking Approved Applicator, whose level of workmanship mirrored the very high standard required for this period building from both aesthetic and waterproofing perspectives.

THE RESULT

The roof alone has transformed the look of the whole house. Viking EcoStar Seneca Shake Roof tiles not only achieved the desired look, but offered a stronger and lighter weight solution which came with a 50-year product warranty.

The homeowner was ecstatic that the quality of their home had been enhanced, character of the building protected, with little-to-no maintenance required.

Healthier Home

Roof ventilation is an important element of a home's design. Without effective ventilation, excess heat and humidity can render costly consequences, such as damp, mould and rot. Your home will benefit from correct ventilation in both summer and winter.

Viking EcoStar's venting system incorporates the Viking 'Ecovent'; the strength of which offers unmatched durability and protection against rain, snow and ice, whilst providing a breathable, yet efficient barrier in virtually all weather conditions.

Viking StrandSarking

StrandSarking Substrate

The structural integrity of Viking EcoStar asphalt is enhanced through the installation of a treated timber sarking substrate onto which they are fastened.

StrandSarking is an H3.1 treated strand board designed and manufactured in New Zealand specifically as a substrate for StrandSarking's benefits far outweigh alternative substrates.

Lightweight

Viking Roofspec's pitched roofing systems installed over StrandSarking with a total weight of up to 25kg/m² may be considered 'light-weight' for design purposes in accordance with NZS3604.

Safety

This durable and light-weight substrate, braces the entire building; negating the need for extra structural requirements for heavy-weight roofing materials.

A more rigid roof

StrandSarking is more rigid and spans further than plywood, minimising: the propensity for the board to sag between trusses; the visibility of sheet joints; and any unevenness in the structure, creating a more rigid, flatter and sharper looking roof.
